

## **Release of residual fuel in a residence in PA**

A residence in PA was affected by the release of heating oil from a disused oil tank and the release produced copious fumes making it difficult for the owners to live. They contracted an Environment company for the cleanup. The storage tank was corroded and the stains of oil could be seen at the bottom of the tank and stains are visible on the wall behind. The conventional method of getting rid of smell was followed and large blowers were installed to drive away the fumes. There was no improvement even after 3 months and the company decided to use VaporRemed for removing the fumes.

**Sarva Bio Remed, LLC**  
**11 North Willow Street**  
**Trenton, NJ 08608**

The requirement was fairly urgent since the project has been going on for more than three months hence the environment company decided to collect VaporRemed directly from us along with the sprayer. VaporRemed was applied directly on the surface of the basement and also wherever the stains of heating oil were visible. After one application of VaporRemed the fumes were completely gone and the blower fans were removed. There is no report of recurrence of fuel oil odor again.
